

Full-fat Whole Canola Seed

Full-fat whole canola seed, containing approximately 21% crude protein and 40% fat, has been successfully fed to lactating cows, primarily as a source of supplemental energy. The maximum recommended feeding rate is 2.5 lbs/cow/day - providing about 1 lb/day of fat. The seeds must be adequately crushed to be of value since unprocessed seed is virtually indigestible due its hard, oily coat. Product containing a significant amount of mustard should be avoided because of its negative effect on palatability.
